

Outcome 1 Rubric

std	P (Proficient)	S (Sufficient)	D (Developing)	I (Insufficient)	N (No evidence)
1.1	Uses input() effectively with comments to explain how user input flows through the program AND writes error-free programs that integrate input into meaningful logic.	Uses input() correctly in simple programs AND input is read and used properly without errors.	Program reads input but contains minor syntax errors (e.g., missing parenthesis) OR input is not stored/used correctly, though logically correct.	Input statements are incorrect, unused, or logically faulty (e.g., wrong variable usage).	No use of input().
1.2	Produces clear, formatted, meaningful output and uses comments to explain reasoning behind output structure AND all output statements run without error.	Uses print() statements correctly to display required information.	Output generally works but has minor syntax errors.	Incorrect output, missing results, or logical errors in what's printed.	No output provided.
1.3	Executes a correct swap using comments to explain each step of the algorithm AND produces an error-free program demonstrating the swap in context.	Correctly swaps two variables using a temporary variable in a simple code snippet.	Attempt resembles a swap but contains syntax OR trivial errors that prevent execution.	Incorrect process OR logical misunderstanding (e.g. overwriting values).	No attempt.
